Independent Originality Review

Manuscript: A Multi-Cohort Evaluation of Heart Failure Prediction: Paired Resampling, Model Transport and Feature-Group Analysis

Authors: Vivek Patel, Umang Patel, Jeetu Mehra and Priyansh T

Document: U24AI040-Paper.pdf, 5 pages

Submitted on: 2 November 2026

Document SHA-256:
9c42d3cb5ae9bcf36759755128193cd141de8dbdddc24e48892b51a120523c70

Assessment

An independent, limited text-overlap and source-attribution review was performed on the manuscript identified above. The review found short textual matches with an earlier version of the authors' work and substantive reuse of several analyses. It did not establish an official similarity percentage or determine whether plagiarism has occurred.

SciSpace similarity scan

The attached SciSpace plagiarism detection report, scan ID brqn930ew1u6, records a total text match of 0.9% (34 of 3,645 words). It reports 0% minor changes and 0% paraphrased matches. The scan time is 1 November 2026 at 16:26 UTC.

Two internet sources were identified: Rane et al., Discrete-Time Survival Analysis for Heart Failure Mortality Prediction (0.6%), and a copy of the SUPPORT prognostic model article (0.3%). The highlights in the supplied scan appear in reference entries [2] and [9]. References, quotes and citations were not omitted according to the displayed scan settings.

SciSpace displays 15 processed pages, whereas the submitted paper has five pages; the displayed scan reflows the paper text. The scan shows the manuscript title and matching content but does not provide the input file SHA-256. AI detection was switched off, so no AI-writing score is available.

Scope and method

The manuscript text before its reference list was compared with three locally available documents: the authors' earlier six-page heart-failure paper, the supplied reference paper, and Ali et al.'s 2023 heart-failure article. Text was normalised and searched for exact continuous matches of at least eight tokens. A previous review also searched eight selected manuscript snippets on the public web. This is a targeted comparison; it does not search all published, unpublished or student work and may not detect paraphrases or material missed by PDF extraction.

Independent Originality Review

Findings

Earlier author work. The exact-text comparison identified 11 short matching sequences, including author or affiliation information, standard methods and results wording, and the requested dataset acknowledgement. The two manuscripts also reuse the same paired SMOTE, UCI survival and SUPPORT external-evaluation analyses. The feature-group analysis is an additional component in the current manuscript. The earlier paper's publication or review status was not independently established.

Other local documents. No continuous match of eight or more normalised tokens was identified by this method against the supplied reference PDF or the local copy of Ali et al. This finding is limited to the text successfully extracted and compared.

Public web review. No verbatim match was confirmed among the returned results for the eight selected snippets checked in the earlier review. Search-engine coverage is incomplete, and these searches do not constitute a comprehensive similarity check.

Attribution and prior work

The manuscript cites the UCI dataset literature, Ali et al., SMOTE, and prior heart-failure leakage and survival studies, including Rane et al. and Naeem et al. It also acknowledges the Vanderbilt SUPPORT data source. The authors should disclose the earlier manuscript and explain the relationship between the studies if required by the intended venue.

Interpretation

This report is an independent review, **not a Turnitin or iThenticate report, a plagiarism-free certificate, or an AI-detection assessment**. The 0.9% figure above is specific to the attached SciSpace scan; no Turnitin, iThenticate or AI-writing percentage is claimed. If an institutional similarity report is required, the exact manuscript identified above should be checked through the institution's authorised service and its source-level matches reviewed. A similarity score, when available, is not by itself a determination of plagiarism.
